SUBNETTING USING THE CISCO PACKET TRACER

AIM:

To implement classless IP subnetting and configure communication between different subnets using cisco packet tracer.

STEPS:

1. subnetting is the process of dividing a large IP network into smaller networks called subnets.
2. classless subnetting uses a variable-length.
3. In this experiment, the network 192.168.1.0/24 is dividing using /27 subnet mask.
4. A /27 subnet provides 32 total addresses and 30 usuable host addresses.
5. the subnet mask for /27 is 255.255.255.224
6. subnetting helps in efficient IP address utilizati and reduces traffic.
7. different subnets can communicate through router.

RESULT:

Thus, a classless IP subnetting was sucessfull implemented in cisco packet tracer, and connectivity between different subnets was verified using ping command.
